BUILDING PROTECTION & SURFACE SYSTEMS

Beyond the surface.
Engineered to protect.

Waterproofing, epoxy and PU flooring, decorative and permeable surfaces, engineered from the cause up.

01 ABOUT COREGUARD

Protection is not a product.
It's a system.

At Coreguard, we believe surface protection is more than applying a coating. It is about understanding the substrate, identifying the challenge and engineering the right system for lasting performance.

We bring together material science, technical expertise and precision application to protect, strengthen and enhance built environments, across two disciplines: building protection, which keeps water out of the structure, and surface systems, which give it floors, decks and pathways that perform.

Our approach is driven by performance, not products. Every project is evaluated on its own requirements, so we can select the right materials, methods and systems for the job.

AT A GLANCE

Two disciplines
Building protection and surface systems

Brand-independent
Systems selected for the site, never the other way round

Cause first
We understand the problem before we recommend a solution

Pan-India
Homes, buildings and industrial sites

> “We don't believe in one-size-fits-all solutions. We believe in understanding every surface, engineering the right system and executing it with precision.
>
> OUR COMMITMENT

AREAS OF EXPERTISE

BUILDING PROTECTION

Terrace & roof waterproofing	p.03
Bathroom & wet-area membranes	p.03
Basement & foundation sealing	p.03
Podium waterproofing & expansion joints	p.03

SURFACE SYSTEMS

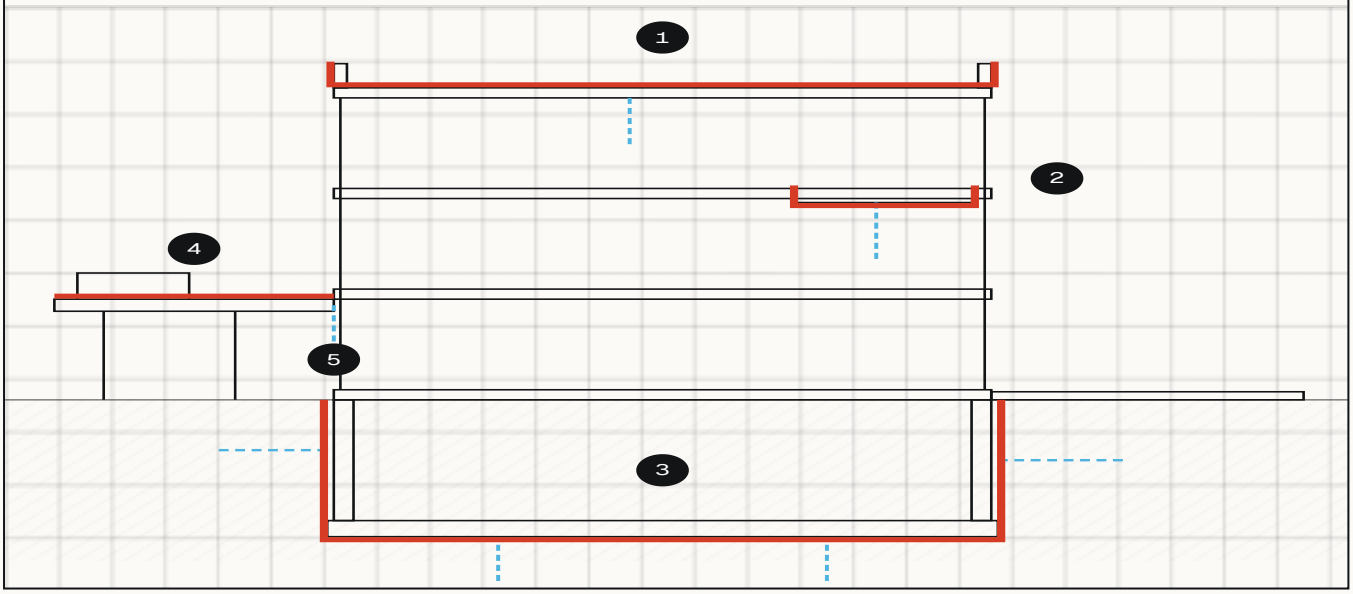

Interior & industrial epoxy / PU floors	p.04
Liquid-grinding decorative floors	p.04
Vehicular & parking decks	p.04
Permeable paving & pathways	p.04

02 BUILDING PROTECTION

Every part of a building, fails differently.

Water finds the joints, cracks, penetrations and pressure points the eye can't see. The stain is where it ends up, not where it gets in.

BUILDING SECTION · AREAS WE PROTECT NTS

	AREA	WHAT YOU MIGHT NOTICE	WHAT WE WOULD CONSIDER
01	**Terrace & roof**	Damp patches on the top-floor ceiling after rain; water standing on the terrace.	Correct slopes and outlets, then liquid-applied membranes with reinforced upturns.
02	**Bathrooms & wet areas**	A wet patch on the ceiling of the flat below; hollow tiles; damp at the foot of walls.	Flexible membranes, sealed penetrations and epoxy grouting before tiling.
03	**Basement & foundation**	Damp walls, white salt marks, a musty smell, seepage at floor-wall joints.	Crystalline treatments, injection grouting and cementitious coatings.
04	**Podium**	Leaks into the car park or rooms below planters; staining along slab joints.	Membranes with root-resistant and protection layers, drained correctly.
05	**Expansion joints**	Leaks and cracking exactly where the structure moves.	Joint systems designed to move with the building without opening up.

03 SURFACE SYSTEMS

Floors, decks & pathways.
Specified for what they carry.

The surfaces people walk and drive on, engineered for the substrate beneath them and the traffic, weather and wear above.

INTERIOR

Epoxy flooring

HOMES · OFFICES · RETAIL · SHOWROOMS

A seamless, jointless finish that is easy to clean and holds its shine, from high-gloss to matte.

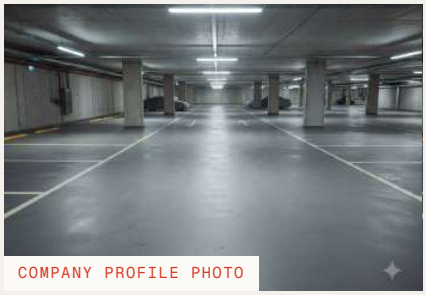

DECORATIVE

Liquid-grinding floors

LOBBIES · COURTYARDS · FEATURE FLOORS

A poured-and-ground aggregate finish with real depth and texture. An alternative to tile or stone.

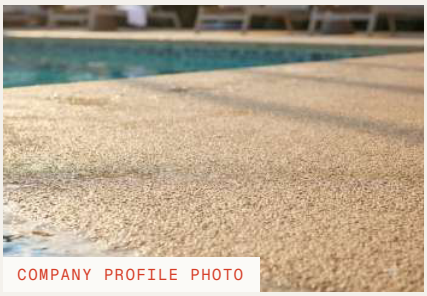

VEHICULAR

Parking decks

BASEMENTS · MULTI-STOREY CAR PARKS

Abrasion-resistant epoxy and PU systems for wheel loads and oil, with clear line marking.

EXTERIOR & WET AREAS

Epoxy / PU decks

POOL DECKS · TERRACES · BALCONIES

UV-stable and slip-resistant, for direct sun, chlorine and constant foot traffic.

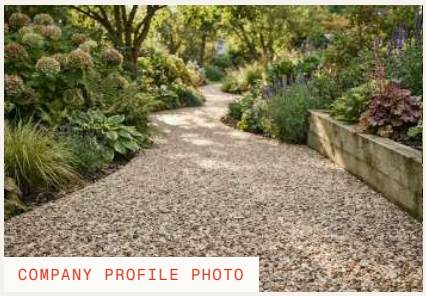

PERMEABLE

Pervious granule paving

PATHWAYS · OPEN PARKING · POOL SURROUNDS

Water passes through the surface instead of pooling on it: no puddles, less runoff.

OUTDOOR

Pathways & walkways

GARDENS · PODIUMS · SOCIETY COMMON AREAS

A textured, slip-safe finish made for sun, rain and heavy footfall, season after season.

04 OUR APPROACH

Understand before we apply.
Every problem has a cause.

01

Understand before we apply

Every surface has a story, and every problem has a cause.

We begin by assessing site conditions, substrate characteristics, exposure levels and performance requirements before recommending a solution.

02

Materials & technologies

The right material makes all the difference.

We select solutions for compatibility, performance, durability and project-specific requirements. Our approach is brand-independent and focused on the right technical outcome.

03

Engineered application

Performance depends on more than the material itself.

From surface preparation and system specification to controlled application and finishing, we focus on precision at every stage of execution.

04

Built for long-term performance

Protection should deliver value beyond the day of application.

We prioritise durability and functionality, helping extend surface life while reducing premature deterioration and maintenance demands.

MATERIALS & TECHNOLOGY

We select the system for the structure. Never the structure for the system.

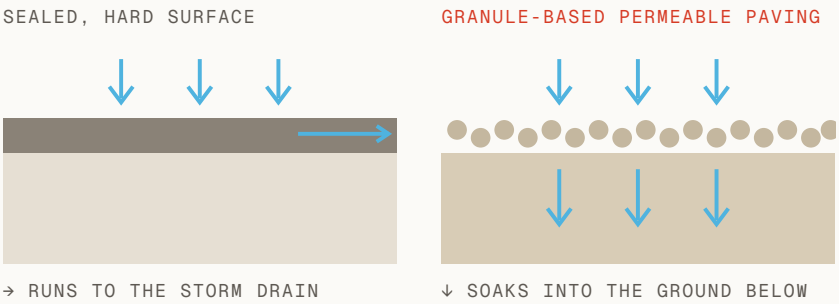

We select and apply building protection and surface systems based on project requirements, substrate conditions and intended performance. Our solutions may incorporate technologies from established manufacturers, including Sika, where appropriate. The system used is named in each project's written specification.

05 PERMEABLE SURFACES

Why permeable surfaces matter.

Sealed, hard surfaces send rainwater straight to the storm drain. Every square metre of concrete, tile or asphalt is a square metre that no longer lets water soak into the ground beneath it.

Granule-based permeable paving works differently. Water passes through the surface and into the ground below, recharging groundwater, easing pressure on local drains and reducing surface flooding during heavy rain.

It is a small material choice at the level of one driveway or courtyard. At the scale of a housing society or campus, it changes how the whole site behaves through the monsoon.

Recharges	Groundwater, instead of sending it to the drain
Reduces	Local flooding and runoff in heavy rain
Stays usable	Minutes after the rain stops, with no puddles

06 WHERE WE WORK

One standard.
Three ways in.

HOMES

Protect your home

For homeowners and housing societies: a clear answer, one accountable team.

BUILDINGS

Protect your asset

For commercial buildings and facility managers: predictable, documented execution.

INDUSTRY

Engineer performance

For industrial clients, developers and architects: specification to handover.
