SURFACES · PROTECTION · PERFORMANCE

Surfaces that define spaces.
Engineered beneath.

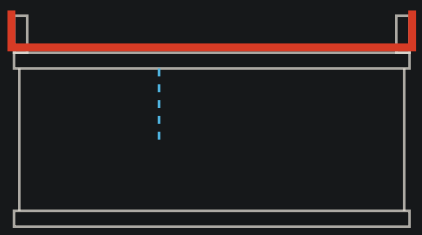

From designed floors to building protection and permeable surfaces, we create systems that respond to how a space is used, how a building performs and how water moves.

01 · DESIGNED SURFACES

Floors with character.

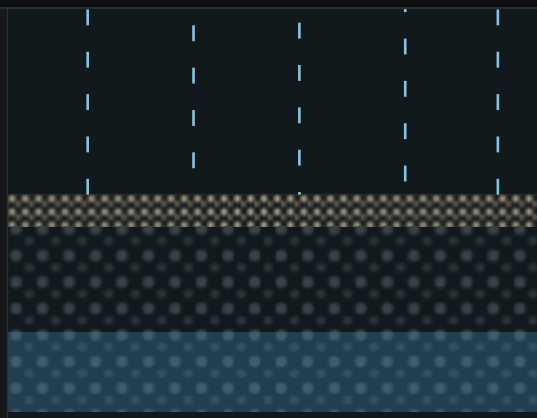

Decorative resin, terrazzo-style and aggregate, flake and quartz, specialist floors.

02 · BUILDING PROTECTION

Water kept out.

Terraces, wet areas, basements, podiums and joints, diagnosed first.

03 · PERMEABLE SURFACES

Rain, returned to the ground.

External surfaces that let water through, where the site allows.

05 Our approach

06 Working with us

01 ABOUT COREGUARD

Surfaces. Protection. Performance.

A surface can be beautiful. It can be durable. It can protect the structure beneath it. And in the right place, it can let rain return to the ground. Coreguard works across all of it.

PILLAR 01

Designed surfaces

Decorative and specialist floors that set the character of a space and stand up to how it is used.

- Decorative epoxy & PU
- Terrazzo-style & aggregate finishes
- Flake, quartz & textured systems
- Industrial floors with intent

PILLAR 02

Building protection

Finding how water gets in, then choosing and detailing the system that keeps it out.

- Terraces & roofs
- Bathrooms & wet areas
- Basements & foundations
- Podiums, decks & joints

PILLAR 03

Permeable surfaces

External surfaces that let water pass through, be stored in the sub-base and, where the ground allows, soak back in.

- Resin-bound aggregate paths
- Permeable paving
- Driveways & suitable parking
- Landscaped external areas

At Coreguard, we believe surface protection is more than applying a coating. It is about understanding the substrate, identifying the challenge and engineering the right system for lasting performance.

Our approach is driven by performance, not products. Every project is evaluated on its own requirements, so we can select the right materials, methods and systems for the job.

AT A GLANCE

Three disciplines
Designed surfaces, protection, permeable surfaces

Brand-independent
Systems selected for the site

Cause first
We assess before we recommend

02 DESIGNED SURFACES

A floor sets the character.
Of the whole space.

Colour, aggregate, texture and finish decide how a room feels. The substrate, the system and the application decide how long it stays that way. We design for both.

Decorative epoxy

SEAMLESS · GLOSS TO MATTE

Jointless surfaces in solid colours or subtle effects, easy to clean.

PU & seamless resin

SOFTER UNDERFOOT · FLEXIBLE

A quieter, more forgiving surface that tolerates movement and temperature.

Terrazzo-style & aggregate

GROUND AND POLISHED

Chosen aggregates set in a matrix and ground back to reveal depth.

Liquid-grinding finishes

POURED AND GROUND IN PLACE

Real texture across large areas, an alternative to tile or stone.

Flake & quartz systems

BROADCAST · TEXTURED

Hard-wearing, slip-resistant and forgiving of daily marks.

Textured & specialist

ANTI-SLIP · BESPOKE

Grip, inlays, patterns or particular effects where a space needs them.

Industrial with intent

PERFORMANCE + APPEARANCE

Heavy traffic, chemicals and hygiene, and still looking right.

Outdoor decorative

DECKS · PATHS · SURROUNDS

UV-stable decks and paths for sun, water and bare feet.

01

Residential

Living areas, kitchens, balconies, villas.

02

Hospitality

Lobbies, restaurants, pool decks, spas.

03

Retail

Showrooms where the floor carries the brand.

04

Commercial

Receptions, offices, circulation.

05

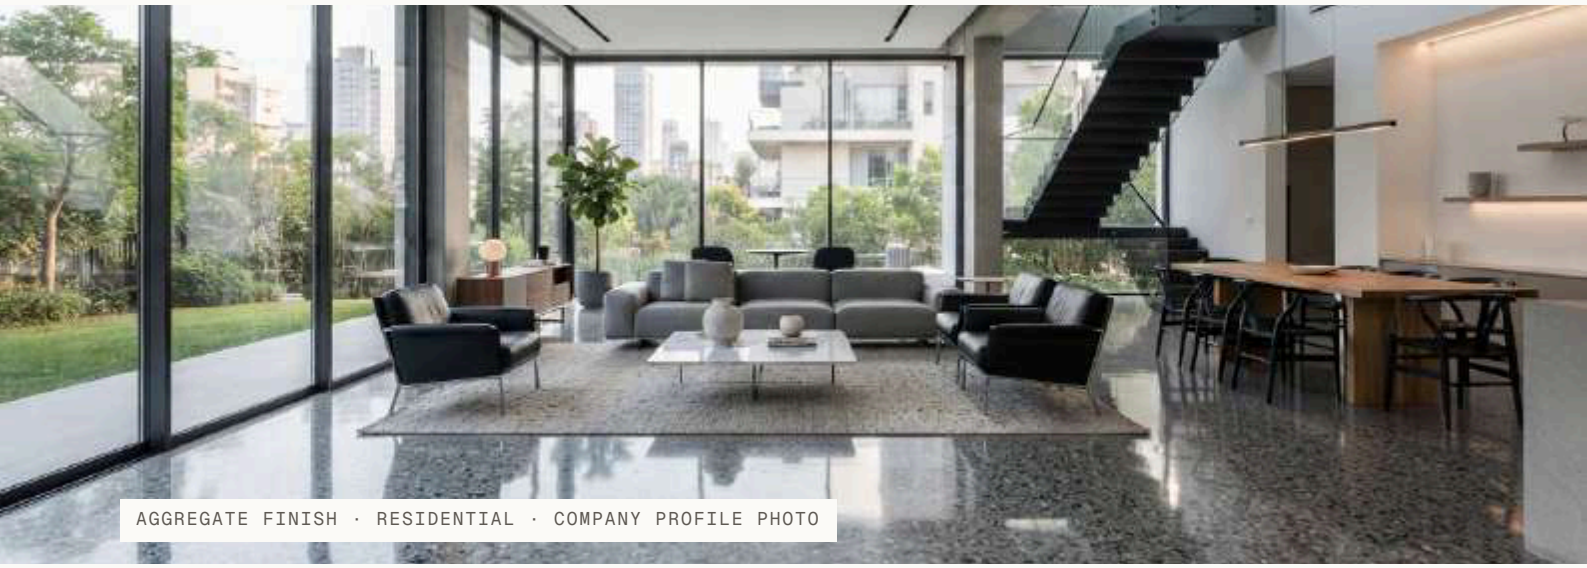

Institutional

Schools, clinics, public buildings.

06

Industrial

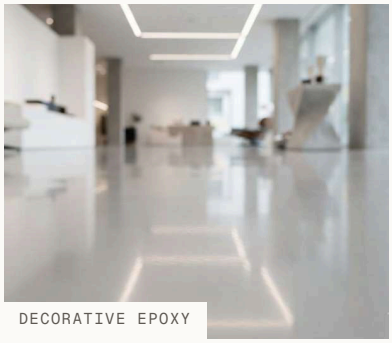

Production and storage, looks and performance.

AGGREGATE FINISH · RESIDENTIAL · COMPANY PROFILE PHOTO

LIQUID GRINDING

DECORATIVE EPOXY

EXTERIOR DECK

PARKING DECK

OUTDOOR PATH

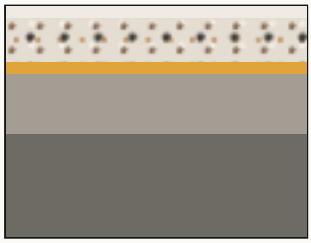

PERFORMANCE ENGINEERED BENEATH

ILLUSTRATIVE BUILD-UPS · SPECIFIED PER SITE

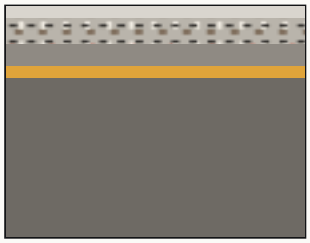

Decorative epoxy

- Topcoat
- Decorative body coat
- Primer
- Levelled screed
- Slab

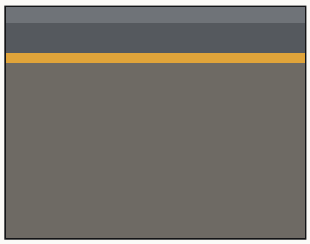

Terrazzo-style

- Polished face
- Aggregate in matrix
- Bond coat
- Screed
- Slab

Flake & quartz

- Sealing coat
- Broadcast
- Resin base
- Primer
- Slab

Industrial & parking

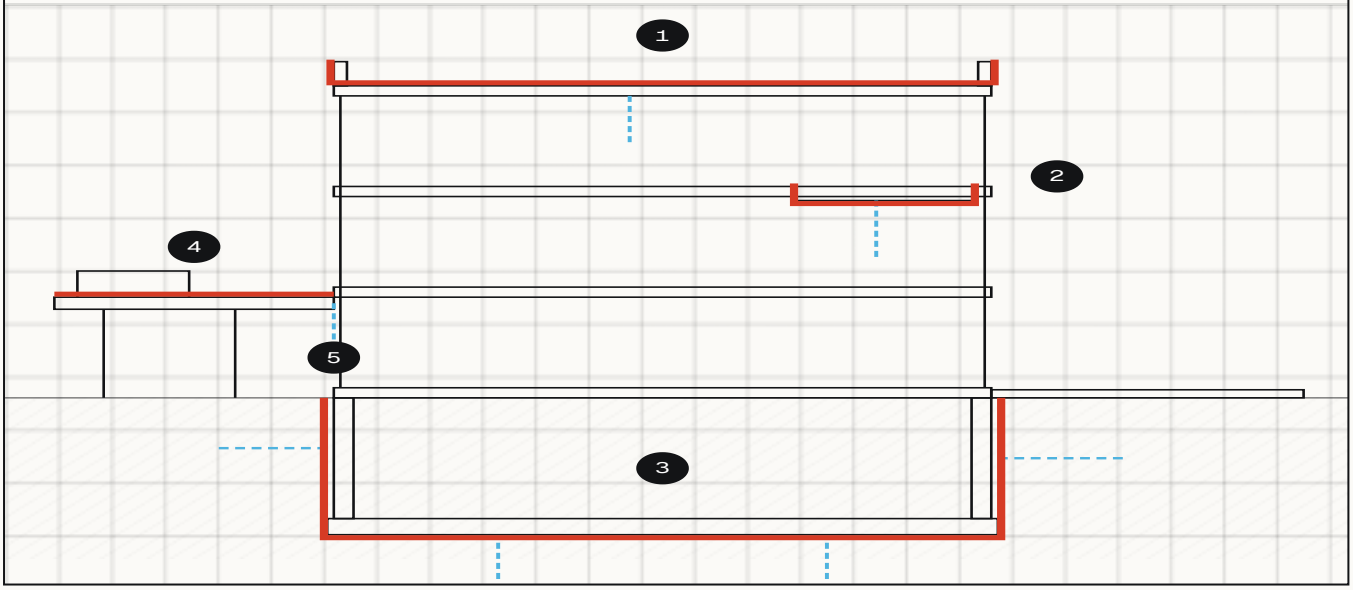

- Wear topcoat
- Epoxy / PU body
- Primer
- Slab

03 BUILDING PROTECTION

What happens beneath a surface. And behind it.

Water finds the joints, cracks, penetrations and pressure points the eye can't see. The stain is where it ends up, not where it gets in.

BUILDING SECTION · AREAS WE PROTECT · ILLUSTRATIVE NTS

	AREA	WHAT YOU MIGHT NOTICE	WHAT WE WOULD CONSIDER
01	**Terrace & roof**	Damp patches on the top-floor ceiling after rain; water standing on the terrace.	Correct slopes and outlets, then liquid-applied membranes with reinforced upturns.
02	**Bathrooms & wet areas**	A wet patch on the ceiling of the flat below; hollow tiles; damp at the foot of walls.	Flexible membranes, sealed penetrations and epoxy grouting before tiling.
03	**Basement & foundation**	Damp walls, white salt marks, a musty smell, seepage at floor-wall joints.	Crystalline treatments, injection grouting and cementitious coatings.
04	**Podium**	Leaks into the car park or rooms below planters; staining along slab joints.	Membranes with root-resistant and protection layers, drained correctly.
05	**Expansion joints**	Leaks and cracking exactly where the structure moves.	Joint systems designed to move with the building without opening up.

04 PERMEABLE SURFACES & WATER-SENSITIVE DESIGN

Let the ground breathe.
Surfaces that work with water.

Most external surfaces send every drop of rain across the top and into a drain. A properly designed permeable surface lets water pass through, holds it in a purpose-built aggregate sub-base and, where the ground allows, lets it soak back in.

THE COMPLETE SYSTEM

1 · Surface
Resin-bound aggregate, permeable paving or pervious concrete.

2 · Bedding or laying course
Free-draining, sized so fines do not wash down.

3 · Open-graded sub-base
Coarse aggregate that carries load and holds water in its voids.

4 · Temporary storage
Voids fill in heavy rain, then release slowly.

5 · Sub-grade & outlet
Tested soil decides how the water leaves.

WHERE THE WATER GOES

Full infiltration
Water soaks into the ground. Only where soil tests show it can take the water.

Partial infiltration
Some soaks in; an outlet carries the excess away at a controlled rate.

No infiltration (lined)
For high groundwater or unsuitable soil. Water is stored and released slowly through an outlet.

A surface can protect. And in the right place, it can let rain return to the earth.

01 **Soil permeability**
Tested on site first.

02 **Groundwater**
High water tables need a lined system.

03 **Slope**
Sub-base designed so water does not run downhill inside it.

04 **Traffic loading**
Paths, driveways and parking differ.

05 **Sediment**
The main cause of clogging.

06 **Maintenance**
Sweep or vacuum. Never seal, sand or pressure-wash.

07 **Drainage rules**
Outlets follow local requirements.

08 **Right place**
Not every surface should be permeable.

05 OUR APPROACH

Understand before we apply.
Assessment leads to the right solution.

DESIGNED SURFACES

What the floor must look like, and survive

Design intent, use and traffic, substrate condition and moisture, cleaning.

BUILDING PROTECTION

Where water gets in, and why

Symptoms and history, ingress paths, joints and interfaces, exposure.

PERMEABLE SURFACES

Whether the ground can take it

Soil permeability, groundwater, slope, loading and drainage rules.

01 **Understand before we apply**

Every surface has a story, and every problem has a cause.

Site conditions, substrate, exposure and performance requirements come first.

02 **Materials & technologies**

The right material makes all the difference.

Selected for compatibility, performance and durability. Brand-independent.

03 **Engineered application**

Performance depends on more than the material.

Preparation, specification, controlled application and finishing.

04 **Built for long-term performance**

Value beyond the day of application.

Durability and functionality, with fewer premature failures and less maintenance.

MATERIALS & TECHNOLOGY · NOT EVERY RESIN SURFACE IS THE SAME

SURFACE	HOW IT IS MADE	LETS WATER THROUGH?
Epoxy & PU floors	Seamless resin coating or screed on a prepared substrate	IMPERMEABLE
Terrazzo-style & aggregate	Aggregate in a cementitious or resin matrix, ground and polished	IMPERMEABLE
Resin-bonded aggregate	Resin spread on a base, loose aggregate scattered over it	IMPERMEABLE
Resin-bound aggregate	Aggregate mixed with resin, trowelled to an open finish	PERMEABLE ON A PERMEABLE BASE
Permeable paving	Units with open, gravel-filled joints over a free-draining build-up	PERMEABLE

We select and apply systems based on project requirements, substrate conditions and intended performance. Our solutions may incorporate technologies from established manufacturers, including Sika, where appropriate. The system used is named in each project's written specification.

06 WORKING WITH US

One standard.
The right conversation.

HOMES

For your home

- Designer floors & finishes
- Terrace & bathroom protection
- Driveways, paths, permeable options

COMMERCIAL

For your space

- Reception, retail, hospitality floors
- Podium, parking & roof protection
- Landscaped external surfaces

INDUSTRY & PROJECTS

For your project

- Industrial epoxy & PU systems
- Waterproofing packages
- Permeable external works

START A CONVERSATION

Tell us what you need.

A designed floor, protection from water or a better external surface. Tell us about the space, and we will arrange a visit and explain our recommendation before quoting.
